

“In code, it is very common to use other people’s work. Of course, the whole end result should not be an entire replica of another’s work. However, it’d simply be silly to have to write every piece of every project when many use the same programs and functions. Things like common button shapes, image displays, formatting, etc. things that any good programmer should already know how to write themselves but would rather not spend time on the more creative and personal parts of a project. I mean, we even had a week of class demonstrating how to utilize other people’s work in our own projects. I think using other people’s work becomes problematic when it starts to take other people’s creativity. Art and writing is always a hot topic when it comes to plagiarism.”
